

We have a workflow that is intended to read connection information to multiple databases from a single configuration database and then loop through the connections to perform a set of actions. This workflow works fine with the use of legacy dtbase reader component. However it runs into multiple issues with the new Db connector node.

1. The following is the structure to the loop

When trying to set the Database Type from flow variable exactly as specified. It runs into the following error message

In addition, trying to set the password through variable constantly fails with the message
